SERVICES GONE WILD: HAS WILDLIFE SERVICES’ PREDATOR CONTROL PROGRAM GONE TOO FAR?

“When they do kill livestock or pets, predators aren’t trying to ruin your day, cut into your profit, or break your heart; they’re simply struggling to survive.”1

I. INTRODUCTION

A federal agency named “Wildlife Services” would lead a reasonable person to believe that its goal is to serve and protect all wildlife.2 And Wildlife Services (WS), a federal program under the United States Department of Agriculture, does protect certain animal species through disease monitoring, conservation of threatened and endangered animals, and resolving wildlife conflicts with humans.3 WS, however, also kills tens of thousands of animals annually through barbaric means funded by millions of taxpayer dollars.4 The primary justification for the slaughter is to protect livestock.5 While livestock protection is a legitimate interest, WS faces constant criticism for using unnecessary violent and inhumane means of killing, which is detrimental to various ecosystems.6

Predator control programs exist at both the state and federal level.7 State predator control programs differ from the federal pro-

3. See id. (outlining goal of WS programs); see also Roddy Scheer & Doug Moss, The USDA’s “Predator Control” Program, ENVTL. MAG. (Nov. 18, 2012), http://www.cemagazine.com/earth-talk/The-USDAs-Predator-Control-Program (noting non-harmful WS activities).

5. Id. (explaining purpose of killing predators). For further discussion of the primary reason for killing predators, see infra notes 28-30 and accompanying text.

7. For a further discussion of the differences between state and federal programs, see infra notes 32-35 and accompanying text.
gram in that they tend to target predators specific to their region.\textsuperscript{8} State programs receive pushback due to their contribution to ecological damage and violent killings, which mirrors the dissatisfaction federal programs face.\textsuperscript{9}

The most evident problem with predator control programs is the methods utilized in killing the animals.\textsuperscript{10} A severe lack of regulation in this area compounds the issue and allows predators to be unnecessarily tormented prior to being killed.\textsuperscript{11} Lack of oversight and regulation, however, does not comprise the full extent of all the issues these animals face.\textsuperscript{12} For example, eliminating a particular species from a designated area for any reason can have a negative impact on that ecosystem’s biodiversity.\textsuperscript{13} This negative impact could potentially result in livestock deaths, the occurrence of which is the main purpose for killing predators in the first place.\textsuperscript{14} In these instances, control programs would be counterintuitive, and cause more harm than good.\textsuperscript{15}

Predator control programs also have the ability to remove particular animals from endangered and threatened species lists in order to decrease their population.\textsuperscript{16} This process is dangerous because it can become difficult to track the number of animals

II. Exchanging Grazing Fees for Livestock Protection: Everybody Wins, Except Predators

The federal government first began researching predators and their effect on livestock in 1907.27 The Bureau of Biological Survey (BBS) and the United States Department of Agriculture (USDA) studied predators, such as wolves and coyotes, and reported on methods for controlling their populations.28 One driving force behind the movement towards predator control was a newly implemented grazing fee, which was imposed on ranchers who allowed their livestock to graze on federal land.29 The government “‘felt that there was an obligation to offer some protection for livestock’” in exchange for the fee ranchers were charged.30 Accordingly, in 1915, the United States government granted $125,000 to the BBS, the first federal assistance issued for predator control.31

While the federal predator control program has, for the most part, subsumed state programs, a few western states have continued their separate species-specific programs.32 These programs allow state governments to target predators unique to their regions.33 All predator control programs, however, rely on the cooperation and financial assistance of “local, state, and federal government and livestock producers.”34 This combined effort grants necessary financial support along with non-monetary requirements of predator control, such as the delisting of an endangered species.35 For example, sometimes a state program will need a federal agency to delist a species from the endangered species list in order to continue their program.36

A. Wildlife Services’ Federal Predator Control Program

WS, an agency of the USDA’s Animal and Plant Health Inspection Service (APHIS), currently manages the federal predator control program.37 The statutory authority for the program is vested in the Animal Damage Control Act of March 2, 1931, which states:

The Secretary of Agriculture may conduct a program of wildlife services with respect to injurious animal species and take any action the Secretary considers necessary in conducting the program. The Secretary shall administer the program in a manner consistent with all of the wildlife services authorities in effect on the day before October 28, 2000.38

The program seeks to protect livestock from predators, which WS assigns as a large problem in the western states and an increasing one in the eastern states.39 The blame for loss of livestock, however, cannot be placed solely on predators.40 It is therefore necessary to identify the specific cause of loss prior to determining practical predation management.41 Unfortunately, WS does not use a precise system to distinguish between livestock loss due to predation and livestock loss due to other events.42 Instead, they use an unscientific assessment of the dead livestock and the surrounding area to determine the cause of loss.43 Additionally, USDA statistics have shown that “most livestock losses result from weather, disease,
illness and birthing problems – not predation.” 44 In 2005, for example, 104.5 million cattle were raised in the United States. 45 Of those 104.5 million, predators killed 0.18% while 3.69% died from other causes. 46

A problem arises when the percentage of predators killed in order to save livestock is disproportionate to the small percentage of livestock that are actually injured or killed by predators. 47 The threshold issue of identifying the reason for loss is crucial for making predation control productive. 48 When the loss is improperly identified, the system of control is bound to fail. 49

After WS ostensibly identifies livestock loss due to predation, it must then determine which method of control to implement to manage the predators. 50 The process begins when livestock producers contact WS about livestock losses due to predation. 51 From there, WS will oftentimes visit the site to obtain information and gather evidence on the predators causing the problem. 52 WS officials then analyze any methods of control already utilized and survey the surrounding land. 53 If both WS and the livestock producers agree that WS should implement predator control at the site, they negotiate and sign an “Agreement For Control of Animal Damage”. 54 The agreement outlines the activities WS will conduct to control predation in that area, and the funding for those meth-

44. See Scheer & Moss, supra note 3 (noting factors other than predation that cause majority of livestock loss).

48. See id. (reviewing necessary first step of identifying reason for livestock loss).
49. See id. (noting consequences of disregarding identifying reason for livestock loss).
52. See id. (discussing site visits by WS officials).
53. See id. (explaining information WS needs prior to implementing predation control).
54. See id. (explaining agreement formed between WS and livestock producer allowing for implementation of predation control methods).
ods.\textsuperscript{55} As a final step, WS implements the predation control program.\textsuperscript{56}

The National Environmental Policy Act (NEPA) compels WS to analyze the impacts each predator control program will have on the environment.\textsuperscript{57} Further, NEPA requires this information be made available to the public prior to implementing the program.\textsuperscript{58} The information given to the public, however, is determined by WS itself, which gives WS a considerable amount of control over what information to ultimately release.\textsuperscript{59} Though WS provides some insight into its analysis, they still lack transparency regarding most predation control issues.\textsuperscript{60}

In response to an overabundant gray wolf population throughout the state, Wyoming officials implemented a predator-specific control program.\textsuperscript{61} The Wyoming Game and Fish Department (WGFD) has stated that a majority of the land in the state is unsuitable for the gray wolf due to livestock grazing.\textsuperscript{62} Prior to 2012, however, the gray wolf was on the federal list of threatened and endangered species, thus prohibiting state officials from implementing a predator control program aimed at their population.\textsuperscript{63}

The gray wolf was reintroduced to Wyoming’s Yellowstone National Park in 1995 to increase their small and diminishing population.\textsuperscript{64} After the reintroduction, WGFD argued that the wolf population decreased to such a point that it was necessary to help increase their population by physically putting them into the ecosystem. \textit{Id.}
population had begun expanding beyond the regulated boundaries, which negatively impacted livestock.\(^{65}\) In response, on August 31, 2012, the U.S. Fish and Wildlife Service (FWS) delisted the gray wolf in Wyoming and placed state officials in charge of their management.\(^{66}\) While numerous environmental groups opposed the delisting of the gray wolf, FWS was within the bounds of the law, and thus no legal action could be taken in response to the agency’s decision.\(^{67}\)

The purpose of the Endangered Species Act of 1973 (Act) “is to protect and recover imperiled species and the ecosystems upon which they depend.”\(^{68}\) While the Act gives guidelines as to what can and cannot be done to listed species, it has “‘provided no criteria for deciding when a species should be listed, delisted or ‘down-listed’ from endangered to threatened’. . . .”\(^{69}\) The ensuing consequences for wolves in Wyoming have been significant.\(^{70}\)

As a result of Wyoming state officials taking control of wolf population management, wolves can be legally hunted, subject to the region of Wyoming they inhabit.\(^{71}\) Wyoming is divided into two areas: Trophy Game Management areas and Predatory Animal areas.\(^{72}\) The Trophy Game Management areas contain habitats suitable to maintain the current gray wolf populations.\(^{73}\) Hunting, therefore, is highly regulated in these areas, and wolves can only be hunted during identified hunting seasons.\(^{74}\) WGFD also sets mortality quotas for each hunting season, which ensure that the gray

72. Id. (characterizing wolf hunting areas).
73. Id. (explaining habitat of Trophy Game Management areas).
74. Id. (discussing enhanced hunting regulations of Trophy Game Management areas because of their suitable populations of gray wolves).
The predatory animal areas, however, are unsuitable for wolves because they contain livestock that the wolves inevitably encounter and prey upon. In these areas, gray-wolf hunting is virtually unregulated. For example, gray wolves may be shot on sight by anyone, regardless of the season or whether the shooter has a hunting license. The lack of regulation has led to these areas being described as “kill-at-will” areas. Unfortunately, these “kill-at-will” predatory animal areas comprise more than eighty percent of Wyoming.

Wyoming’s “kill-at-will” policy has sparked outcry from both environmental groups and scientists. Both groups argue that the purpose of the Act is to ensure endangered species regain a healthy population. The gray wolf population, however, has not reached what is normally considered a healthy size when compared with other delisted species. In fact, recent studies have determined that the delisting of the gray wolf was not “based on the ‘best available science,’” which consequently has put the wolves in danger of extinction. Thus, these findings have reopened the debate regarding whether WS’s delisting of the gray wolf was appropriate and WS is currently in the process of reexamining the determination.

C. Alaska and the Airborne Hunting Act: Finding a Loophole to Kill Grizzly Bears

Alaska is another state that conducts state-specific predatory control through its “intensive management” programs. Similar to other predator control programs, Alaska’s primary reason for engaging predatory control is to protect the state’s livestock and other ungulates used as food sources. Alaska is specifically interested in protecting moose, caribou, and deer populations from wolves and bears. Hence, the Alaska Department of Fish and Game (ADFG) states that the goal of its predator management programs “is to allow humans to take more ungulates, while also maintaining sustainable populations of predators.”

In 1994, Alaska passed the Intensive Management Law. The law “requires the Alaska Board of Game to identify moose, caribou, and deer populations that are especially important food sources for Alaskans, and to insure that these populations remain large enough to allow for adequate and sustained harvest.” The Alaska Board of Game (ABOG) must, however, opt for a predator control implementation plan prior to the commencement of any intensive management program. These implementation plans have been adopted in the Alaska Administrative Code, and allows the ADFG to regulate predation management.

Many of Alaska’s implementation plans involve aerial hunting as the specified method of killing predators. Aerial hunting is highly controversial, however, and was even prohibited by the fed-

87. Id. (comparing motivation for separate state predator control programs).
88. See Intensive Management in Alaska, supra note 86 (discussing predators targeted in Alaska based on what animals need protection).
89. Id. (noting balance of Alaska’s predator control program).
91. See Intensive Management in Alaska, supra note 86 (quoting statutory authority).
92. Id. (explaining first step in process of conducting predator management in Alaska).
93. Id. (discussing implementation plans). The implementation plans “contain detailed information about each predation control area.” Id. Each plan is tailored to the particular predator and prey. Id.
94. See Kennedy & Fiorino, supra note 90 (noting use of aerial hunting in Alaska predation management programs).
eral Airborne Hunting Act of 1971 (AHA). Congress passed the AHA to “prohibit[ ] shooting, attempting to shoot or harass any animal from an aircraft . . . .” The AHA, however, allows for an exception to the aerial hunting ban when it is done to protect wildlife and livestock. Thus, the AHA allows Alaska to issue permits for aerial hunting, which is considered “unsportsmanlike, unethical and nearly impossible to regulate.”

Alaska specifically targets grizzly bears as a targeted predator due to their prevalence and fondness for moose. While there are only 1,500 grizzly bears in the contiguous United States, Alaska notably harbors 31,000. The grizzly bear, therefore, is not endangered in Alaska, as it is elsewhere in the United States. Unlike in Wyoming, where the type of predator targeted causes concern, Alaska’s problem with its intensive management programs is the method of killing utilized.

III. METHODS OF PREDATOR CONTROL: PROBLEMS AND POTENTIAL SOLUTIONS

Due to their endangered or threatened status, the species targeted by predator control programs is often the main point of debate, as it is in Wyoming. The way the programs control the predators, however, is a separate but equally important problem, as seen in Alaska. Notably, the methods of predator control may

95. Id. (analyzing Alaska’s use of aerial hunting as means for predator control).
96. Id. (quoting Airborne Hunting Act).
97. See id. (noting Act’s loophole).
98. Id. (discussing Alaska’s propensity to act on exceptions within Act).
102. See Kennedy & Fiorino, supra note 90 (discussing aerial hunting as being highly controversial).
103. For a further discussion of delisting species for predator control, see supra notes 61-70 and accompanying text. For a further discussion of Wyoming’s predator control program, see supra notes 71-80.
104. See Predator Defense, supra note 4 (giving overview of methods of predator control). For a discussion of Alaska’s intensive management program, see supra notes 86-93.
utilize lethal means, and are not required to be necessary or humane. For example, hunters often use poison, steel-jaw traps, and clubbing as unnecessary and torturous means of managing predators. Not only do these methods of killing inflict “unnecessary pain and suffering” on the predators, but they also cause “broad ecological harm” by negatively affecting the habitats and livestock claimed to be protected in the first place. Furthermore, using these barbaric methods does not protect livestock any more than non-lethal alternatives.

One problem in particular with WS’ federal predator control program is that WS does not document whether non-lethal or lethal methods of control are implemented. This allows WS to avoid explaining why they used lethal methods of control when non-lethal means were potentially available and more appropriate. To progress and make positive changes to the way these predators are being controlled, it is important that WS begin tracking and recording its actions. As a result of WS’ consistent refusal to take initiative and begin this process, the Defenders of Wildlife (Defenders), an environmentalist group, petitioned the USDA’s Office of the Inspector General (OIG) to audit WS and its predator control program. If successful, the audit would delve into the different types of control and why federal and state programs use them. The audit would also eliminate the lack of transparency by forcing those in charge of the predator control programs to explain and support their actions. If the programs could not be explained, the inefficiency of the programs would be-

106. See id. at 41 (suggesting barbaric methods of predator control).
107. See id. at 41-42 (expanding upon negative ecological impacts of predator control).
108. See id. at 42 (noting livestock saved is same regardless of killing method used against predators).
110. See id. (analyzing WS’ lack of transparency).
111. See id. (noting negative impacts from WS’ lack of reporting).
112. See id. (reviewing petition in support of auditing WS to hold them liable).
114. See id. (noting audit would force issue of transparency).
come public knowledge, which would likely lead to necessary changes.\textsuperscript{115} Unfortunately, the initial audit, scheduled for 2013, was moved to 2014; further, budget constraints may limit the OIG and cause the audit to be dropped.\textsuperscript{116} Congressional Representatives Peter DeFazio (D-OR), John Campbell (R-CA), and Gary Peters (D-MI) recently “renewed their demand for an audit,” and were “supported by more than 157,000 Defenders and Natural Resources Defense Council members and online activists.”\textsuperscript{117}

Supporters of a WS audit consistently condemn aerial hunting as a method of predator control.\textsuperscript{118} As previously explained, aerial hunting is so barbaric that federal law prohibits the practice.\textsuperscript{119} Aerial hunting involves “using a plane to harass an animal to exhaustion in winter where there is no cover and no opportunity for the animal to escape.”\textsuperscript{120} Further, this type of killing “rarely results in a clean kill” because of the unsteady nature of hunting from a moving aircraft.\textsuperscript{121} The AHA has banned aerial hunting since 1971 because of the torture it puts animals through.\textsuperscript{122} By virtue of passing the AHA, Congress recognized that killing animals this way is unethical and cruel.\textsuperscript{123} For thirty-five years, however, Alaska has circumvented the AHA, which may lead other states to follow suit.\textsuperscript{124}

In addition to circumventing the AHA, Alaska’s intensive management program does not require ABOG personnel to be the aerial hunters.\textsuperscript{125} Instead, Alaska officials allow private citizens and pilots to hunt, providing no structure or regulation to aerial hunting.\textsuperscript{126} Conversely, authorizing only ABOG personnel to hunt could move the program in a more humane direction because at

\item \textsuperscript{121} See id. (analyzing negative impact of hunting from planes).
\item \textsuperscript{122} See id. (discussing 1971 statutory authority prohibiting aerial hunting).
\item \textsuperscript{123} See Aerial Hunting FAQs, supra note 118 (proffering reasons for legislation).
\item \textsuperscript{124} See id. (explaining how Alaska has allowed residents to participate in banned aerial hunting).  For a further discussion on aerial hunting, see supra notes 94-98 and accompanying text.
\item \textsuperscript{125} Id. (noting lack of regulation in who can utilize control methods).
\item \textsuperscript{126} See id. (discussing ability of anyone to aerial hunt if they wish).
\end{itemize}
the very least, ABOG personnel would have the proper training and experience.\textsuperscript{127} Given its consequences, the current lack of guidelines for aerial hunting is truly astounding.\textsuperscript{128}

To eliminate the negative effects of aerial hunting, environmentalist groups are advocating for the enactment of the Protect America’s Wildlife Act (PAW).\textsuperscript{129} PAW would offer better protections to wildlife from aerial hunters and would close the loophole of AHA that has been exploited by Alaska’s intensive management program.\textsuperscript{130} PAW was introduced to Congress in 2009, but it has not yet been enacted.\textsuperscript{131} PAW strikes a suitable balance between acknowledging a state’s right to manage wildlife how it sees fit and instituting guidelines that would make its choice of management more humane.\textsuperscript{132}

In addition to advocating for the use of non-lethal methods of predator control, some environmentalist groups are advocating for the reallocation of resources to make livestock less vulnerable to attack.\textsuperscript{133} Implementing this type of livestock protection, rather than using those resources to kill predators, would be a much more productive measure.\textsuperscript{134} One livestock protection measure is the use of guardian animals.\textsuperscript{135} Guardian animals are trained to protect other animals, such as livestock, twenty-four hours a day “and are alert and protective during the hours of greatest danger.”\textsuperscript{136} It is uncommon for a guardian animal to kill a predator, given that its presence alone is typically enough to scare off any would-be attackers; however, if that is not the case, it will resort to chasing the predator away.\textsuperscript{137} Another non-lethal method that focuses on decreasing livestock vulnerability includes constructing physical barri-

\begin{itemize}
\item \textsuperscript{127} Id. (explaining lack of regulation concerning who can aerial hunt).
\item \textsuperscript{128} See Aerial Hunting FAQs, supra note 118 (explaining issues with aerial hunting).
\item \textsuperscript{129} See id. (explaining how PAW would positively impact predator control programs).
\item \textsuperscript{130} Govtrack.us, S. 1535 (111th): Protect America’s Wildlife Act of 2009, https://www.govtrack.us/congress/bills/111/s1535 (last visited Feb. 14, 2014) (reviewing proposed bill). PAW would ban aerial hunting in its entirety; there would no longer be a loophole. Id.
\item \textsuperscript{131} See id. (discussing bill’s current location).
\item \textsuperscript{132} See Aerial Hunting FAQs, supra note 118 (discussing impact of PAW).
\item \textsuperscript{133} See Conley, supra note 109 (examining alternative use of resources).
\item \textsuperscript{134} See id. (discussing solution of reallocation of resources).
\item \textsuperscript{135} See Ekarius, supra note 1 (explaining guardian animals as alternative to predator control programs).
\item \textsuperscript{136} Id. (describing guardian animals).
\item \textsuperscript{137} Id. (noting alternative is not lethal to predators).
\end{itemize}
Although this method can be costly, a possible cost-effective solution would be to transfer the funds that are used for killing the predators and apply them toward the construction of barriers.

IV. PREDATOR CONTROL AND THE DISRUPTION OF BIODIVERSITY

Predator control disrupts ecosystem biodiversity and can cause irreversible damage due to the natural complementary features among specific animals in those ecosystems. Biodiversity is “the variety and variability among living organisms and the ecological complexes in which they occur.” Ecosystems, therefore, require biodiversity to survive and flourish. Predators are among those animals necessary to keep a balanced ecosystem. While predation involves the killing of certain animals, it also “permits the evolution and accumulation of species and serves to regulate the growth of plant and animal populations.” Predation, therefore, maintains biodiversity within ecosystems.

Problems arise when humans interrupt this naturally occurring phenomenon by killing off predators to increase the number of prey. A lack of predators and subsequent increase in prey would lead to over-browsing. Consequently, human interference with natural predation impedes plant and animal growth. Predator control tends to focus strictly on one predator species at a time. What predator control programs fail to do is recognize the harm inflicted on the broader ecosystem. This is supported by “[s]udies in national parks in six different North American ecosystems – Yellowstone, Yosemite, Wind Cave, Zion, and Olympic National...”

147. See id. (linking decrease in predators to overabundance of prey).
148. Id. (noting consequence of predator control on ecosystem growth).
149. See id. (noting predation control does not take into account larger picture of all animals in ecosystem).
150. See Edvenson, supra note 105, at 35 (explaining failure of predation control programs).
Parks in the United States, and Jasper National Park in Canada – [which] have shown that ecosystems unravel when ‘keystone’ predators are removed.”151 Furthermore, species that are not targeted by predator control programs are affected indirectly.152 Interdependence of predators and prey is not taken into account with these programs, and that must change.153

Predator control programs can also frustrate biodiversity as a result of the programs’ lack of selectivity.154 Some programs utilize methods of control that might target specific predators, but fail to protect predators that do not prey on livestock.155 For example, certain programs implement poisoning as a means of killing specific predators; because these tactics are not target-oriented, officials are unable to predict which predators ingest the poison.156 Other programs utilizing aerial hunting often kill unintended predators due to the unsteady nature of shooting from a moving plane.157

Aside from the programs that kill non-target predators, some programs refuse to acknowledge the rest of the ecosystem’s reliance on the predator-prey relationship, which is harmed by the program’s interference.158 Dick Randall, a “predator control officer” explained, “Indiscriminate destruction may make frustrated ranchers feel better, but it only creates more problems. . . . The only time a lethal control method ever works is when it is directed at the animal actually doing the damage.”159

Predator control programs may bring about both unexpected and counterproductive biological responses from predators, further highlighting the negative biodiversity impacts of predator con-

152. See Edvenson, supra note 105, at 47 (discussing second-hand affects on non-targeted animals).
153. See id. (noting predator control programs failure to take into account necessary ecosystem relationships).
154. Id. (explaining non-selectivity of predator control programs). Non-selective predator control programs are those that either kill predators relied upon by the rest of the ecosystem or kill non-problem predators. Id.
155. Id. (discussing type of non-selectivity affecting rest of ecosystem).
156. See id. (noting how non-problem animals can be affected by predation management).
157. See Edvenson, supra note 105, at 47 (describing particular methods of control with high probability of killing non-problem animals).
158. Id. (noting another variation of non-selectivity and its consequences).
159. Id. at 47-48 (explaining how non-selective predator control programs negatively impact environment).
For example, in some situations predator control programs can cause predators to adapt to the circumstances and resist the control. Coyotes, for instance, were found to favor live sheep over their dead counterparts due to “decades of lacing dead sheep with poison” as a means of control. Further, some predator control methods can actually increase the population of predators. Studies have revealed larger coyote litters in areas where coyotes are subject to trapping and shooting methods of control, as opposed to smaller litters in those areas they are not subject to the control. In areas where coyote pups were just removed from the vicinity, as opposed to killed, however, adult coyote predation decreased substantially.

Another problem predator control inflicts upon biodiversity is the migration of predators to different ecosystems. When a predator population is being controlled by lethal methods, it is not unlikely that the predators will simply move to another territory. Not only does the introduction of a predator have consequences for the new ecosystem, but the removal of a predator upsets the biodiversity of the original ecosystem as well.

The absence of certain predators in a particular ecosystem can cause a rippling effect throughout the environment. For example, the foraging behavior of prey might change due to the absence of predators. Particularly, prey may begin to over-browse specific plants. In turn, this over-browsing can cause a decrease in that

plant species, and in some instances, total extinction.\textsuperscript{172} The extinction or decrease of certain plants can then cause instability of streams and channels and their floodplain functions.\textsuperscript{173} Researchers also determined that this negative cascade of effects could not be attributed to any other environmental factors.\textsuperscript{174} Rather, the loss of predators was the most significant factor.\textsuperscript{175}

V. ECONOMIC AND FUNDING ISSUES WITH PREDATOR CONTROL PROGRAMS

Predator control programs, like other government programs, cost taxpayers money.\textsuperscript{176} Funding for predator control programs comes from the federal government, state governments, counties, livestock associations, and individuals.\textsuperscript{177} As of 2009, the federal government alone was spending ten million dollars annually on predator control and protecting livestock.\textsuperscript{178} When predator-related livestock losses are over-reported, funding for predator control programs is unwarrantedly increased.\textsuperscript{179}

In some instances, it has been shown that no predator control would cost less than active control.\textsuperscript{180} A predator research expert stated, “‘[t]hey will limit their own numbers if you leave them alone.’”\textsuperscript{181} This is particularly true in cases where more predators are killed than the livestock they purportedly take.\textsuperscript{182} Unfortunately, livestock loss reports are not highly regulated.\textsuperscript{183} This cre-

\textsuperscript{174}. See Donahue, supra note 12, at 265 (concluding negative consequences on foraging behaviors due to absence of predators caused by predation management).
\textsuperscript{175}. Id. (furthering conclusion that predator absence negatively impacts prey).
\textsuperscript{176}. See Edvenson, supra note 105, at 72 (explaining taxpayer cost of predator control programs).
\textsuperscript{177}. Id. at 51 (explaining where funding for programs comes from).
\textsuperscript{179}. See Edvenson, supra note 105, at 51 (explaining lack of reporting regulations causing unnecessary funding of predation management).
\textsuperscript{180}. Id. at 50 (discussing high cost of predation management).
\textsuperscript{181}. Id. (explaining biodiversity will limit predators naturally).
\textsuperscript{182}. See id. at 50-51 (discussing consequence of human interruption of naturally occurring biodiversity).
\textsuperscript{183}. For a further discussion of lack of predator control program regulations, see supra notes 109-124 and accompanying text.
ates skepticism about whether ranchers are accurately reporting losses due to predators.\textsuperscript{184}

While there has been plenty of pushback against this extreme spending, the livestock industry’s support of the funding has impeded attempts at funding cutbacks.\textsuperscript{185} For example, House Representatives in support of the livestock industry shut down a proposed amendment to the Department of Agriculture appropriations bill that would “cut all WS funds for lethal wildlife control.”\textsuperscript{186} Ranchers have a large interest in predator control because of the tight market surrounding the economics of livestock.\textsuperscript{187} This argument, however, fails when the view shifts once again to the fact that much of the funding spent on predator control is not actually controlling targeted predators.\textsuperscript{188}

VI. THE FUTURE OF PREDATOR CONTROL

“USDA Wildlife Services is the only federal program that kills native predators at the request of ranchers and state wildlife management agencies.”\textsuperscript{189} This unique feature of predator control programs is a big reason why the programs need to be reexamined and more heavily regulated.\textsuperscript{190} While predator control programs do not seem to be on a path to extinction, a considerable number of environmentalist groups are actively trying to, at a minimum, slow them down.\textsuperscript{191} For example, Defenders is rallying against the delisting of the gray wolf.\textsuperscript{192} Unfortunately, many of the efforts to make predator control programs more effective and less destructive are based on petitions, which do not necessarily instigate immediate action.\textsuperscript{193}

\begin{itemize}
\item \textsuperscript{184} See Edvenson, supra note 105, at 51 (discussing lack of transparency in predation management causing higher costs to implement programs).
\item \textsuperscript{185} See Thrower, supra note 177, at 337 (discussing deep support for predation management funding).
\item \textsuperscript{186} Id. (discussing bill that would cut funding was rejected due to massive support for funding).
\item \textsuperscript{187} Id. (noting “tight market” for livestock ranching).
\item \textsuperscript{188} Id. (explaining counterproductive nature of predator control programs).
\item \textsuperscript{189} See PREDATOR DEFENSE, supra note 4 (explaining uniqueness of predator control programs).
\item \textsuperscript{190} See id. (explaining process of killing predators has negative consequences that go unregulated and unnoticed).
\item \textsuperscript{192} Id. (explaining particular support from environmental groups for Wyoming’s gray wolves).
\item \textsuperscript{193} Id. (noting lack of formal change initiatives).
\end{itemize}
Defenders has taken the approach that the long-term view of making predator control programs more positive is the best way to make a change.\textsuperscript{194} They are focusing their resources on changing what they can, but more importantly looking ahead to major overhauls of the control programs.\textsuperscript{195} The numerous environmental groups, like Defenders, are bringing much needed attention to the issue of predation management and its negative impacts on the environment.\textsuperscript{196} WS’ current reexamination of the delisting of the gray wolf shows that steps are being taken to reform predation management and move it in a more positive direction.\textsuperscript{197}

The main goal of most predation management reform supporters is not necessarily eliminating such programs altogether.\textsuperscript{198} Rather, reporters would like to see transparency within the programs.\textsuperscript{199} As it stands now, both federal and state predator control programs are able to hide information about their services from the public.\textsuperscript{200} As Congressman DeFazio puts it: “Wildlife Services is one of the most opaque and least accountable agencies I know of. It is not capable of reforming itself. They need a mandate for reform . . . it’s going to have to be imposed on them.”\textsuperscript{201} Currently, they are not required to explain themselves or their methods of control.\textsuperscript{202} If this requirement were implemented, predation management officials would be required to explain their reasoning behind particular methods of control, and keep more accurate records of the killings they perform.\textsuperscript{203} This information will allow
